# Package 'nnet' 

February 2, 2016
Priority recommended
Version 7.3-12
Date 2016-02-02
Depends R ( $>=2.14 .0$ ), stats, utils
Suggests MASS
Description Software for feed-forward neural networks with a single hidden layer, and for multinomial log-linear models.
Title Feed-Forward Neural Networks and Multinomial Log-Linear Models
ByteCompile yes
License GPL-2 | GPL-3
URL http://www.stats.ox.ac.uk/pub/MASS4/
NeedsCompilation yes
Author Brian Ripley [aut, cre, cph],

Index

## Description

Generates a class indicator function from a given factor.

## Usage

class.ind(cl)

## Arguments

cl factor or vector of classes for cases.

## Value

a matrix which is zero except for the column corresponding to the class.

## References

Venables, W. N. and Ripley, B. D. (2002) Modern Applied Statistics with S. Fourth edition. Springer.

## Examples

\# The function is currently defined as
class.ind <- function(cl)
\{
n <- length(cl)
cl <- as.factor (cl)
$x$ <- matrix(0, n, length(levels(cl)) )
$x[(1: n)+n *(u n c l a s s(c l)-1)]<-1$ dimnames(x) <- list(names(cl), levels(cl))
x
\}
multinom Fit Multinomial Log-linear Models

## Description

Fits multinomial log-linear models via neural networks.

## Usage

multinom(formula, data, weights, subset, na.action, contrasts $=$ NULL, Hess $=$ FALSE, summ $=0$, censored $=$ FALSE, model = FALSE, ...)

## Arguments

| formula | a formula expression as for regression models, of the form response ~ predictors The response should be a factor or a matrix with K columns, which will be interpreted as counts for each of K classes. A log-linear model is fitted, with coefficients zero for the first class. An offset can be included: it should be a numeric matrix with K columns if the response is either a matrix with K columns or a factor with $\mathrm{K}>=2$ classes, or a numeric vector for a response factor with 2 levels. See the documentation of formula() for other details. |
| :---: | :---: |
| data <br> weights | an optional data frame in which to interpret the variables occurring in formula. optional case weights in fitting. |
| subset | expression saying which subset of the rows of the data should be used in the fit. All observations are included by default. |
| na.action | a function to filter missing data. |
| contrasts | a list of contrasts to be used for some or all of the factors appearing as variables in the model formula. |
| Hess | logical for whether the Hessian (the observed/expected information matrix) should be returned. |
| summ | integer; if non-zero summarize by deleting duplicate rows and adjust weights. Methods 1 and 2 differ in speed ( 2 uses C); method 3 also combines rows with the same X and different Y , which changes the baseline for the deviance. |
| censored | If Y is a matrix with K columns, interpret the entries as one for possible classes, zero for impossible classes, rather than as counts. |
| model | logical. If true, the model frame is saved as component model of the returned object. |
|  | additional arguments for nnet |

## Details

multinom calls nnet. The variables on the rhs of the formula should be roughly scaled to $[0,1]$ or the fit will be slow or may not converge at all.

## Value

A nnet object with additional components:

| deviance | the residual deviance, compared to the full saturated model (that explains indi- |
| :--- | :--- |
| vidual observations exactly). Also, minus twice log-likelihood. |  |
| edf | the (effective) number of degrees of freedom used by the model |
| AIC | the AIC for this fit. |
| Hessian | (if Hess is true). |
| model | (if model is true). |

## References

## See Also

nnet

## Examples

```
options(contrasts = c("contr.treatment", "contr.poly"))
library(MASS)
example(birthwt)
(bwt.mu <- multinom(low ~ ., bwt))
```

nnet Fit Neural Networks

## Description

Fit single-hidden-layer neural network, possibly with skip-layer connections.

## Usage

```
nnet(x, ...)
## S3 method for class 'formula'
nnet(formula, data, weights, ...,
    subset, na.action, contrasts = NULL)
## Default S3 method:
nnet(x, y, weights, size, Wts, mask,
    linout = FALSE, entropy = FALSE, softmax = FALSE,
    censored = FALSE, skip = FALSE, rang = 0.7, decay = 0,
    maxit = 100, Hess = FALSE, trace = TRUE, MaxNWts = 1000,
    abstol = 1.0e-4, reltol = 1.0e-8, ...)
```

## Arguments

| formula | A formula of the form class $\sim \mathrm{x} 1+\mathrm{x} 2+\ldots$ |
| :--- | :--- |
| x | matrix or data frame of x values for examples. |
| y | matrix or data frame of target values for examples. |
| weights | (case) weights for each example - if missing defaults to 1. |
| size | number of units in the hidden layer. Can be zero if there are skip-layer units. <br> data |
| Data frame from which variables specified in formula are preferentially to be <br> taken. |  |
| subset | An index vector specifying the cases to be used in the training sample. (NOTE: <br> If given, this argument must be named.) |

| na.action | A function to specify the action to be taken if NAs are found. The default action <br> is for the procedure to fail. An alternative is na.omit, which leads to rejection <br> of cases with missing values on any required variable. (NOTE: If given, this <br> argument must be named.) |
| :--- | :--- |
| contrasts | a list of contrasts to be used for some or all of the factors appearing as variables <br> in the model formula. <br> initial parameter vector. If missing chosen at random. |
| Wts | logical vector indicating which parameters should be optimized (default all). |
| mask | switch for linear output units. Default logistic output units. |
| linout | switch for entropy (= maximum conditional likelihood) fitting. Default by least- <br> squares. |
| entropy | switch for softmax (log-linear model) and maximum conditional likelihood fit- <br> ting. linout, entropy, softmax and censored are mutually exclusive. |
| censored | A variant on softmax, in which non-zero targets mean possible classes. Thus <br> for softmax a row of (0, 1, 1) means one example each of classes 2 and 3, |
| but for censored it means one example whose class is only known to be 2 or 3. |  |

## Details

If the response in formula is a factor, an appropriate classification network is constructed; this has one output and entropy fit if the number of levels is two, and a number of outputs equal to the number of classes and a softmax output stage for more levels. If the response is not a factor, it is passed on unchanged to nnet. default.

Optimization is done via the BFGS method of optim.

## Value

object of class "nnet" or "nnet. formula". Mostly internal structure, but has components
wts the best set of weights found
value value of fitting criterion plus weight decay term.
fitted.values the fitted values for the training data.
residuals the residuals for the training data.
convergence $\quad 1$ if the maximum number of iterations was reached, otherwise 0 .

## Examples

```
# use half the iris data
ir <- rbind(iris3[,,1],iris3[,,2],iris3[,,3])
targets <- class.ind( c(rep("s", 50), rep("c", 50), rep("v", 50)) )
samp <- c(sample(1:50,25), sample(51:100,25), sample(101:150,25))
ir1 <- nnet(ir[samp,], targets[samp,], size = 2, rang = 0.1,
            decay = 5e-4, maxit = 200)
test.cl <- function(true, pred) {
    true <- max.col(true)
    cres <- max.col(pred)
    table(true, cres)
}
test.cl(targets[-samp,], predict(ir1, ir[-samp,]))
# or
ird <- data.frame(rbind(iris3[,,1], iris3[,,2], iris3[,,3]),
            species = factor(c(rep("s",50), rep("c", 50), rep("v", 50))))
ir.nn2 <- nnet(species ~ ., data = ird, subset = samp, size = 2, rang = 0.1,
                decay = 5e-4, maxit = 200)
table(ird$species[-samp], predict(ir.nn2, ird[-samp,], type = "class"))
```

```
nnetHess Evaluates Hessian for a Neural Network
```

## Description

Evaluates the Hessian (matrix of second derivatives) of the specified neural network. Normally called via argument Hess=TRUE to nnet or via vcov.multinom.

## Usage

nnetHess(net, $x, y$, weights)

## Arguments

| net | object of class nnet as returned by nnet. |
| :--- | :--- |
| $x$ | training data. |
| $y$ | classes for training data. |
| weights | the (case) weights used in the nnet fit. |

## Value

square symmetric matrix of the Hessian evaluated at the weights stored in the net.

## See Also

nnet, predict.nnet

## Examples

```
# use half the iris data
ir <- rbind(iris3[,,1], iris3[,,2], iris3[,,3])
targets <- matrix(c(rep(c(1,0,0),50), rep(c(0,1,0),50), rep (c(0,0,1),50)),
150, 3, byrow=TRUE)
samp <- c(sample(1:50,25), sample(51:100,25), sample(101:150,25))
ir1 <- nnet(ir[samp,], targets[samp,], size=2, rang=0.1, decay=5e-4, maxit=200)
eigen(nnetHess(ir1, ir[samp,], targets[samp,]), TRUE)$values
```

## Description

Predict new examples by a trained neural net.

## Usage

\#\# S3 method for class 'nnet'
predict(object, newdata, type $=c(" r a w ", " c l a s s "), \ldots)$

## Arguments

object an object of class nnet as returned by nnet.
newdata matrix or data frame of test examples. A vector is considered to be a row vector comprising a single case.
type Type of output
... arguments passed to or from other methods.

## Details

This function is a method for the generic function predict() for class "nnet". It can be invoked by calling predict ( $x$ ) for an object $x$ of the appropriate class, or directly by calling predict. nnet ( x ) regardless of the class of the object.

## Value

If type = "raw", the matrix of values returned by the trained network; if type = "class", the corresponding class (which is probably only useful if the net was generated by nnet.formula).

## References

Ripley, B. D. (1996) Pattern Recognition and Neural Networks. Cambridge.

```
# use half the iris data
ir <- rbind(iris3[,,1], iris3[,,2], iris3[,,3])
targets <- class.ind( c(rep("s", 50), rep("c", 50), rep("v", 50)) )
samp <- c(sample(1:50,25), sample(51:100,25), sample(101:150,25))
ir1 <- nnet(ir[samp,], targets[samp,],size = 2, rang = 0.1,
            decay = 5e-4, maxit = 200)
test.cl <- function(true, pred){
    true <- max.col(true)
    cres <- max.col(pred)
    table(true, cres)
}
test.cl(targets[-samp,], predict(ir1, ir[-samp,]))
# or
ird <- data.frame(rbind(iris3[,,1], iris3[,,2], iris3[,,3]),
    species = factor(c(rep("s",50), rep("c", 50), rep("v", 50))))
ir.nn2 <- nnet(species ~ ., data = ird, subset = samp, size = 2, rang = 0.1,
            decay = 5e-4, maxit = 200)
table(ird$species[-samp], predict(ir.nn2, ird[-samp,], type = "class"))
```

which.is.max Find Maximum Position in Vector

## Description

Find the maximum position in a vector, breaking ties at random.

## Usage

which.is.max(x)

## Arguments

x
a vector

## Details

Ties are broken at random.

## Value

index of a maximal value.

## References

Venables, W. N. and Ripley, B. D. (2002) Modern Applied Statistics with S. Fourth edition. Springer.

## See Also

max.col, which. max which takes the first of ties.

## Examples

```
## Not run: ## this is incomplete
pred <- predict(nnet, test)
table(true, apply(pred, 1, which.is.max))
## End(Not run)
```
