

# Evolutionary Computational in Finance & Economics

**Edward Tsang**  
 Computing / CCFEA / CIC  
 University of Essex, Colchester, UK  
 IEEE Computational Finance and Economics Technical Committee

## What Computational Finance?

- ◆ What is Artificial Intelligence?
  - Not easy to define
- ◆ Defined by the activities in the community
- ◆ Forecasting and Trading
  - (Rare) opportunities, Arbitrage
- ◆ Automated Trading
- ◆ Optimization
  - Portfolio optimization
- ◆ Understanding markets
  - Automated Bargaining
  - Artificial Markets for
    - Evolving strategies
    - Wind-tunnel testing

Why Computational Finance?      What are the challenges ahead?

21 February 2009      2      All Rights Reserved, Edward Tsang

## Why Computational Finance?

What can be done now:	Enabling technology:
Large scale simulation	Must faster machines
Data warehouse	Much cheaper memory
Building complex models	Agent-technology
Efficient exploration of models	Evolutionary computation (Multi-Obj) Optimisation
Decision support	experimental game theory, constraint satisfaction

21 February 2009      3      All Rights Reserved, Edward Tsang

## Forecasting

Is the market predictable?  
 What exactly is the forecasting problem?

21 February 2009      4      All Rights Reserved, Edward Tsang

## Forecasting

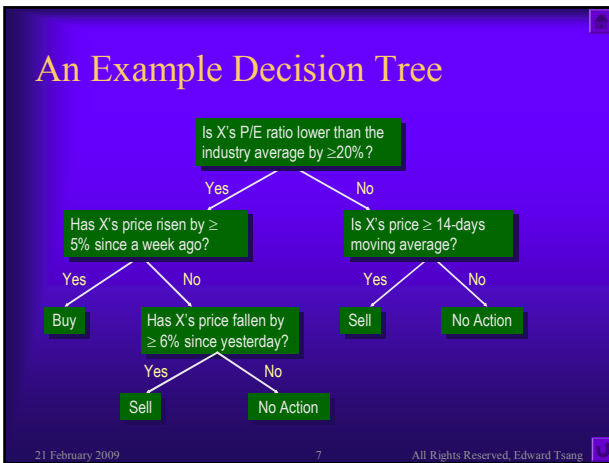

- Will the price go up or down?  
By how much?
- What prices do we have?  
Daily? Intraday (*high frequency*)? Volume?  
Indices? Economic Models?
- What is the risk of crashing?
- Are Option and Future prices aligned?  
(i.e. are there arbitrary opportunities?)

21 February 2009      5      All Rights Reserved, Edward Tsang

## EDDIE adds value to user input

- ◆ User inputs *indicators*
  - e.g. moving average, volatility, predications
- ◆ EDDIE makes *selectors*
  - e.g. "50 days moving average > 89.76"
- ◆ EDDIE combines selectors into *trees*
  - by discovering interactions between selectors
- Finding thresholds (e.g. 89.76) and interactions by human experts is laborious

21 February 2009      6      All Rights Reserved, Edward Tsang

### Syntax of GDTs in EDDIE-2

```

<Tree> ::= "If-then-else" <Condition> <Tree> <Tree> | Decision
<Condition> ::= <Condition> "And" <Condition> |
<Condition> "Or" <Condition> |
"Not" <Condition> |
Variable <RelationOperation> Threshold
<RelationOperation> ::= ">" | "<" | "="
    
```

Variable is an indicator / feature  
 Decision is an integer, "Positive" or "Negative" implemented  
 Threshold is a real number

♦ Richer language ⇒ larger search space

21 February 2009 8 All Rights Reserved, Edward Tsang

### A taste of user input

Given	Expert adds:	More input:	Define target:
Daily closing	50 days m.a.	Volatility	↑4% in 21 days?
90	80	50	.....
99	82	52	1
87	83	53	0
82	82	51	1
.....	.....	.....	.....

21 February 2009 9 All Rights Reserved, Edward Tsang

### Our EDDIE/FGP Experience

- ♦ Patterns exist
  - Would they repeat themselves in the future? (EMH debated for decades)
- ♦ EDDIE has found patterns
  - Not in every series (we don't need to invest in every index / share)
- ♦ EDDIE extending user's capability
  - and give its user an edge over investors of the same caliber

21 February 2009 10 All Rights Reserved, Edward Tsang

### Arbitrage Opportunities

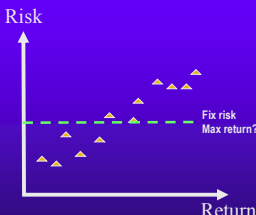

- ♦ Futures are obligations to buy or sell at certain prices
- ♦ Options are rights to buy at a certain price
- ♦ If they are not aligned, one can make risk-free profits
  - Such opportunities should not exist
  - But they do in London

21 February 2009 11 All Rights Reserved, Edward Tsang

## Portfolio Optimization

- ◆ Typically:
  - High risk → high return
  - Diversification reduces risk
- ◆ Task: find a portfolio
  - Maximize return, minimize risk
- ◆ Difficulty: constraints, e.g.
  - No more than  $n$  stocks
  - Not too much on one stock
  - Not too much on one sector
- ◆ Optimization problem
  - Note: how to measure risk?

21 February 2009 13 All Rights Reserved, Edward Tsang

## Automated Trading

## What is Automated Trading?

- ◆ Program makes decisions autonomously
  - Could be expert system, machine learning, technical trading

21 February 2009 14 All Rights Reserved, Edward Tsang

## Computer vs Human Traders

- ◆ Programs work *day and night*, humans can't
- ◆ Programs react in *milliseconds*, humans can't
- ◆ Programs can be *fully audited*, humans can't
- ◆ When programs make mistakes, one can *learn and change the culprit codes*
  - Failed human traders simply change jobs
- ◆ Expertise in computer programs *accumulates*
  - Human traders leave with his/her experience

>> Not to mention costs, emotion, hidden agenda, etc.

21 February 2009 16 All Rights Reserved, Edward Tsang

## FAQ in Automated Trading

- ◆ *Is the market predictable?*
  - It doesn't have to be: just code your own expertise
  - Market is not efficient anyway, herding has patterns
- ◆ *How can you predict exceptional events?*
  - No, we can't
  - Neither can human traders
- ◆ *How can you be sure that your program works?*
  - No, we can't
  - Neither were we sure about Nick Leeson at Barrings
  - Codes are more auditable than humans
  - If you can improve your odds from 50-50 to 60-40 in your favour, you should be happy

21 February 2009 17 All Rights Reserved, Edward Tsang

## Automated Bargaining

### Automatic Bargaining Overview

**n shared variables**

**Supplier** → **Cost** → **Customer**

**Supplier** → **Utility** → **Customer**

**Supplier price defines my cost**

**Who do I know?**

- Maximize profit
- Satisfy constraints
  - purchase
  - sell
  - schedule

**How to bargain?**  
 Aim: to agree on price, delivery time, etc.  
 Constraint: deadlines, capacity, etc.  
 Who to serve? Who to talk to next?

Motivation in e-commerce: talk to many

21 February 2009 19 All Rights Reserved, Edward Tsang

### Bargaining in Game Theory

◆ Rubinstein Model:

**In reality:**  
 Offer at time  $t = f(r_A, r_B, t)$   
 Is it necessary?  
 Is it rational? (What is rational?)

◆ A's payoff  $x_A$  drops as time goes by  
 $A's\ Payoff = x_A \exp(-r_A t \Delta)$

◆ Important Assumptions:  
 - Both players rational  
 - Both players know everything

◆ Equilibrium solution for A:  
 $\mu_A = (1 - \delta_B) / (1 - \delta_A \delta_B)$   
 where  $\delta_i = \exp(-r_i \Delta)$

**Optimal offer:**  
 $x_A = \mu_A$   
 at  $t=0$

**Notice:**  
 No time  $t$  here

21 February 2009 20 All Rights Reserved, Edward Tsang

### Evolutionary Rubinstein Bargaining, Overview

- ◆ Game theorists solved Rubinstein bargaining problem
  - Subgame Perfect Equilibrium (SPE)
- ◆ Slight alterations to problem lead to different solutions
  - Asymmetric / incomplete information
  - Outside option
- ◆ Evolutionary computation
  - Succeeded in solving a wide range of problems
  - EC has found SPE in Rubinstein's problem
  - Can EC find solutions close to unknown SPE?
- ◆ Co-evolution is an *alternative approximation* method to find game theoretical solutions
  - Less time for approximate SPEs
  - Less modifications needed for new problems

21 February 2009 21 All Rights Reserved, Edward Tsang

### Issues Addressed in EC for Bargaining

- ◆ Representation
  - Should  $t$  be in the language?
- ◆ One or two population?
- ◆ How to evaluate fitness
  - Fixed or relative fitness?
- ◆ How to contain search space?
- ◆ Discourage irrational strategies:
  - Ask for  $x_A > 1$ ?
  - Ask for more over time?
  - Ask for more when  $\delta_A$  is low?

21 February 2009 22 All Rights Reserved, Edward Tsang

### Representation of Strategies

- ◆ A tree represents a mathematical function  $g$
- ◆ Terminal set:  $\{1, \delta_A, \delta_B\}$
- ◆ Functional set:  $\{+, -, \times, \div\}$
- ◆ Given  $g$ , player with discount rate  $r$  plays at time  $t$   
 $g \times (1 - r)^t$
- ◆ Language can be enriched:
  - Could have included  $e$  or time  $t$  to terminal set
  - Could have included power  $\wedge$  to function set
- ◆ Richer language  $\rightarrow$  larger search space  $\rightarrow$  harder search problem

21 February 2009 23 All Rights Reserved, Edward Tsang

### Two populations – co-evolution

- ◆ We want to deal with asymmetric games
  - E.g. two players may have different information
- ◆ One population for training each player's strategies
- ◆ Co-evolution, using relative fitness
  - Alternative: use absolute fitness

Evolve over time

21 February 2009 24 All Rights Reserved, Edward Tsang

### Incentive Method: Constrained Fitness Function

- ◆ No magic in evolutionary computation
  - Larger search space → less chance to succeed
- ◆ Constraints are heuristics to focus a search
  - Focus on space where promising solutions may lie
- ◆ Incentives for certain properties in function returned:
  - The function returns a value in (0, 1)
  - Everything else being equal, lower  $\delta_A \rightarrow$  smaller share
  - Everything else being equal, lower  $\delta_B \rightarrow$  larger share

Note: this is the key to our search effectiveness

21 February 2009 25 All Rights Reserved, Edward Tsang

### Models with known equilibriums

Complete Information

- ◆ Rubinstein 82 model:
  - Alternative offering, both A and B know  $\delta_A$  &  $\delta_B$
- ◆ Evolved solutions approximates theoretical
- ◆ Evolved solutions for problems with outside option

Incomplete Information

- ◆ Rubinstein 85 model:
  - B knows  $\delta_A$  &  $\delta_B$
  - A knows  $\delta_A$  and  $\delta_B^{weak}$  &  $\delta_B^{strong}$  with probability  $\Omega_{weak}$
- ◆ Evolved solutions approximates theoretical

21 February 2009 26 All Rights Reserved, Edward Tsang

### Models with unknown equilibriums

- ◆ Modified Rubinstein 85 models
- ◆ Incomplete knowledge
  - B knows  $\delta_B$  but not  $\delta_A$ ; A knows  $\delta_A$  but not  $\delta_B$
- ◆ Asymmetric knowledge
  - B knows  $\delta_A$  &  $\delta_B$ ; A knows  $\delta_A$  but not  $\delta_B$
- ◆ Asymmetric, limited knowledge
  - B knows  $\delta_A$  &  $\delta_B$
  - A knows  $\delta_A$  and a normal distribution of  $\delta_B$
- ◆ Also worked on limited knowledge, outside option
- ◆ Future work: new bargaining procedures

21 February 2009 27 All Rights Reserved, Edward Tsang

### Evolutionary Bargaining, Conclusions

- ◆ Demonstrated GP's flexibility
  - Models with known and unknown solutions
  - Outside option
  - Incomplete, asymmetric and limited information
- ◆ Co-evolution is an *alternative approximation* method to find game theoretical solutions
  - Relatively quick for approximate solutions
  - Relatively easy to modify for new models
- ◆ Genetic Programming with incentive / constraints
  - Constraints used to focus the search in promising spaces

21 February 2009 28 All Rights Reserved, Edward Tsang

## Artificial Market

Markets are efficient in the long run  
How does the market become efficient?  
Do all agents converge in their opinions?

Wind-tunnel testing for new markets

21 February 2009 29 All Rights Reserved, Edward Tsang

### Agent-based Artificial Markets

	Agents	Markets
Applications	<ul style="list-style-type: none"> <li>◆ How to design strategies?                             <ul style="list-style-type: none"> <li>– Given model of market</li> <li>– Evolving robust strategies</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>◆ Market mechanism design                             <ul style="list-style-type: none"> <li>– Enabling scientific testing</li> <li>– Regulatory design</li> </ul> </li> </ul>
Fundamental	<ul style="list-style-type: none"> <li>◆ Equilibrium strategies?                             <ul style="list-style-type: none"> <li>– What would they be?</li> <li>– What if agents change?</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>◆ Market efficiency                             <ul style="list-style-type: none"> <li>– How does it come about?</li> <li>– Under what assumptions?</li> </ul> </li> </ul>

Rich and challenging research, EC plays vital part

21 February 2009 30 All Rights Reserved, Edward Tsang

## Evolving Agents

Should agents adapt to the environment?  
Co-evolution

## The Red Queen Thesis

*In this place it takes all the running you can do, to keep in the same place.*

◆ **Chen & Yeh:**

- Endogenous prices
- Agents are GPs
- “Peer pressure” (relative wealth) lead to agents retraining themselves
- Retraining is done by “visiting the business school”

◆ **Markose, Martinez & Tsang:**

- CCFEA work in progress
- Wealth exhibits Power Law
- Wealth drives retraining
- Retraining is done by EDDIE

21 February 2009 32 All Rights Reserved, Edward Tsang

## Evolving Agents

◆ **Sunders, Cliff:**

- Zero intelligence agents
- Market efficiency can be obtained by zero-intelligence agents as long as the market rules are properly set.
- This result challenges the neoclassical models regarding the utility maximization behaviour of economic agents

◆ **Schulenburg & Ross**

- Heterogenous agents (agents may have different knowledge)
- Agents modelled by classifier systems
- Exogenous prices
- Beat buy-and-hold, trend follower and random walk agents

21 February 2009 33 All Rights Reserved, Edward Tsang

## Conclusions

### Computational Finance & Economics

- ◆ **Computing has changed the landscape of finance and economics research**
  - We can do what we couldn't in the past
- ◆ **Evolutionary computation plays major roles in**
  - Forecasting investment opportunities
  - Approximating subgame equilibrium in bargaining
  - Understanding markets
  - Wind-tunnel testing new market mechanism

21 February 2009 34 All Rights Reserved, Edward Tsang

## Supplementary Information

## Joseph Stiglitz

- ◆ Nobel Economic Prize 2001
- ◆ Senior VP and Chief Economist, World Bank, 1997-2000
- ◆ Critical view on globalization
- ◆ Founder, The Initiative for Policy Dialogue, to:
  - Explore policy alternatives
  - Enable wider civic participation in economic policymaking

21 February 2009 37 All Rights Reserved, Edward Tsang

## Game Theory Hall of Fame

1994 Nobel Prize

John Harsanyi

John Nash

Reinhard Selten

2005 Nobel Prize

Robert Aumann

Thomas Schelling

## Future of Computational Finance

## Opportunities and Challenges in CF&E

- ◆ **Opportunities**
  - New dimensions in market understanding (i)
  - Computer trading will become the norm
  - Wind-tunnel tests will become the norm
- ◆ **Challenges:**
  - Different types of learning mechanism
  - Large number of parameters to tune
  - What can the simulations tell us?

21 February 2009 40 All Rights Reserved, Edward Tsang

## The Computational Finance Community

- ◆ **Conferences:**
  - IEEE International Conference on Computational Intelligence for Financial Engineering
  - Annual Workshop on Economics with Heterogenous Interacting Agents (WEHIA 2005 at Essex, Markose, Sunders, Dempster)
  - International Conference on Computing in Economics and Finance
  - International Joint Conference on Autonomous Agents and Multi-Agent Systems
- ◆ **Useful web sites:**
  - Tesfatsion's Agent-based Computational Economics
  - Chen's AI-ECON Research Centre
- ◆ IEEE Network on Computational Finance and Economic
- ◆ IEEE Technical Committee on Computational Finance and Economics

21 February 2009 41 All Rights Reserved, Edward Tsang

## Rationality

Rationality is the assumption behind many economic theories

What does being rational mean?

Are we rational?

The CIDER Theory

## What is Rationality?

- ◆ Are we all logical?
- ◆ What if **Computation** is involved?
- ◆ Does **Consequential Closure** hold?
  - If we know P is true and  $P \rightarrow Q$ , then we know Q is true
  - We know all the rules in Chess, but not the optimal moves
- ◆ “Rationality” depends on computation power!
  - Think faster  $\rightarrow$  “more rational”

“Bounded Rationality” / CIDER Theory All Rights Reserved, Edward Tsang

### CIDER: Computational Intelligence Determines Effective Rationality (1)

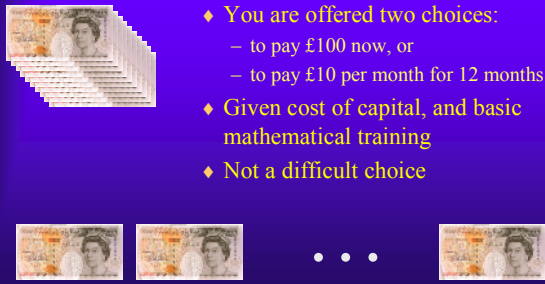

- ◆ You have a product to sell.
- ◆ One customer offers £10
- ◆ Another offers £20
- ◆ Who should you sell to?
- ◆ Obvious choice for a rational seller

21 February 2009 44 All Rights Reserved, Edward Tsang

### CIDER: Computational Intelligence Determines Effective Rationality (2)

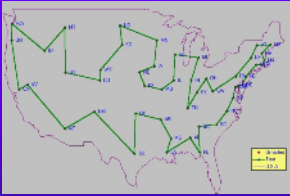

- ◆ You are offered two choices:
  - to pay £100 now, or
  - to pay £10 per month for 12 months
- ◆ Given cost of capital, and basic mathematical training
- ◆ Not a difficult choice

21 February 2009 45 All Rights Reserved, Edward Tsang

### CIDER: Computational Intelligence Determines Effective Rationality (3)

- ◆ Task:
  - You need to visit 50 customers.
  - You want to minimize travelling cost.
  - Customers have different time availability.
- ◆ In what order should you visit them?
- ◆ This is a very hard problem
- ◆ Some could make wiser decisions than others

21 February 2009 46 All Rights Reserved, Edward Tsang

### The CIDER Theory

- ◆ Rationality involves Computation
- ◆ Computation has limits
- ◆ Herbert Simon: Bounded Rationality
- ◆ Rubinstein: model bounded rationality by explicitly specifying decision making procedures
- ◆ Decision procedures involves algorithms + heuristics
- ◆ Computational intelligence determines effective rationality
- ◆ Where do decision procedures come from?
  - Designed? Evolved?

21 February 2009 47 All Rights Reserved, Edward Tsang

### 1978 Nobel Economic Prize Winner

- ◆ Artificial intelligence
- ◆ "For his pioneering research into the decision-making process within economic organizations"
- ◆ "The social sciences, I thought, needed the same kind of rigor and the same mathematical underpinnings that had made the "hard" sciences so brilliantly successful."
- ◆ Bounded Rationality
  - A Behavioral model of Rational Choice 1957

Herbert Simon (CMU)  
Artificial intelligence

Sources: <http://nobelprize.org/economiclaureates/1978/> <http://nobelprize.org/economics/laureates/1978/simon-autobio.html>

21 February 2009 48 All Rights Reserved, Edward Tsang

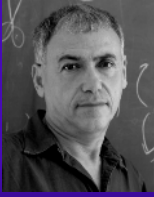

### "Bounded Rationality"

- ◆ Herbert Simon:
  - Most people are only partly rational, and are in fact emotional/irrational in part of their actions
- ◆ "Boundedly" rational agents behave in a manner that is nearly as optimal with respect to its goals as its resources will allow
  - Resources include processing power, algorithm and time available
- ◆ Quantifiable definition needed?

21 February 2009 49 All Rights Reserved, Edward Tsang

### Modelling Bounded Rationality (1998)

Ariel Rubinstein  
New York University

- ◆ Rational decisions are optimal decisions
  - But decisions makers often try to satisfy constraints
  - Rather than finding optimality
- ◆ Rationality comes from decision making procedures
  - Procedures should be specified explicitly
  - This put the study of procedures on the research agenda

21 February 2009 50 All Rights Reserved, Edward Tsang

### Efficient Market Hypothesis

- ◆ Financial assets (e.g. shares) pricing:
  - All available information is fully reflected in current prices
- ◆ If EMH holds, forecasting is impossible
  - Random walk hypothesis
- ◆ Assumptions:
  - Efficient markets (one can buy/sell quickly)
  - Perfect information flow
  - Rational traders

21 February 2009 52 All Rights Reserved, Edward Tsang

### Does the EMH Hold?

- ◆ It holds for the long term
- ◆ “Fat Tail” observation:
  - big changes today often followed by big changes (either + or –) tomorrow
- ◆ How fast can one adjust asset prices given a new piece of information?
  - Faster machines certainly help
  - So should faster algorithms (CIDER)

21 February 2009 56 All Rights Reserved, Edward Tsang

### Test: Syntax – GDTs in EDDIE-2

```

<Tree> ::= "If-then-else" <Condition> <Tree> <Tree> | Decision
<Condition> ::= <Condition> "And" <Condition> |
               <Condition> "Or" <Condition> |
               "Not" <Condition> |
               Variable <RelationOperation> Threshold
<RelationOperation> ::= ">" | "<" | "="
    
```

Variable is an indicator / feature  
Decision is an integer, "Positive" or "Negative" implemented  
Threshold is a real number

- ◆ Richer language  $\Rightarrow$  larger search space

21 February 2009 57 All Rights Reserved, Edward Tsang

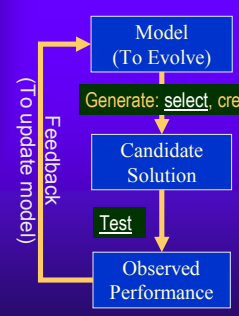

### Evolutionary Computation

A very brief introduction  
Genetic Programming

21 February 2009 58 All Rights Reserved, Edward Tsang

### Evolutionary Computation: Model-based Generate & Test

```

graph TD
    A[Model (To Evolve)] --> B[Generate: select, create/mutate vectors / trees]
    B --> C[Candidate Solution]
    C --> D[Test]
    D --> E[Observed Performance]
    E -- Feedback (To update model) --> A
    
```

- A Model could be a population of solutions, or a probability model
- A Candidate Solution could be a vector of variables, or a tree
- The Fitness of a solution is application-dependent, e.g. drug testing

21 February 2009 60 All Rights Reserved, Edward Tsang

### GP Operators

**Crossover**

**Mutation**: change a branch

21 February 2009 61 All Rights Reserved, Edward Tsang

### Wind-tunnel Testing

Understanding the market  
Searching for market mechanism  
Learning strategies

### Agent-based Artificial Market

**Application**

- Strategy Design**
  - How to do well in market
- Wind Tunnel Market Testing**
  - Designing new markets

**Fundamental**

- What happens when agents evolve?**
- Better understand the market**
  - What makes a market efficient?
  - Ask "what happen if..."

Diagram: Agent 1, Agent 2, ..., Agent n interact with an Artificial Market. Endogenous interactions are shown between agents and the market, while exogenous interactions are shown from the market to agents.

21 February 2009 63 All Rights Reserved, Edward Tsang

### Wind-tunnel tests for new markets

- New markets are being invented
  - e-Bay, electricity, roads
- Model new markets to check if they work
  - Answer what-if questions
  - Evolve agents to approximate equilibriums

21 February 2009 64 All Rights Reserved, Edward Tsang

### Artificial Markets

Understanding the Stock Market

### CHASM Research Summary

Ref: *AI-ECON, Giardina et al 2003, other markets*

**Questions:**

- How does the price change?
- What is the effect of learning by traders?

**CHASM Platform**

Polymorphic

- EDDIE
- Fundamental
- Noise

endogenous

Artificial Market

21 February 2009 66 All Rights Reserved, Edward Tsang

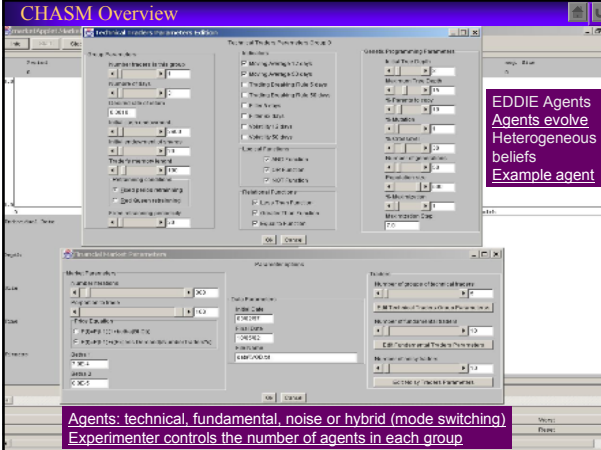

## Red Queen

... Now, *here*, you see, it takes all the running *you* can do, to keep in the same place. If you want to get somewhere else, you must run at least twice as fast as that! ...

21 February 2009 67 All Rights Reserved, Edward Tsang

## CHASM Overview

Agents: technical, fundamental, noise or hybrid (mode switching)  
 Experimenter controls the number of agents in each group

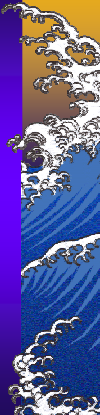

## Artificial Finance Market Conclusions

- ◆ Platform supports wide range of experiments
- ◆ Conditions for stylized facts identified in endogenous, realistic market
- ◆ Agents must be competent and realistic
  - Some must observe fundamental values
- ◆ *Learning* agents (EDDIE-based):
  - Statistical properties of returns and wealth distribution changed
  - No need for fundamental trader!

21 February 2009 69 All Rights Reserved, Edward Tsang

## Credit Card Payment Market

An Agent-based approach

## Why Modelling?

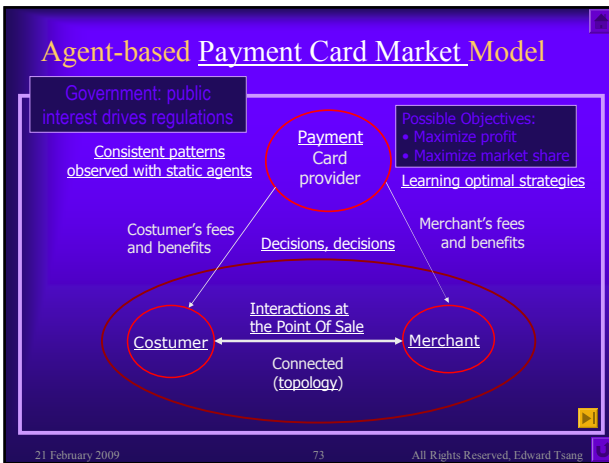

- ◆ Scientific Approach
  - Modelling allows scientific studies.
  - Human expert opinions are valuable,
  - But best supported by scientific evidences
- ◆ Multiple Expertise
  - models can be built by multiple experts at the same time
  - The resulting model will have the expertise that no single expertise can have.
- ◆ Models are investments
  - Models will never leave the institute as experts do.
  - Investments can be accumulated.

21 February 2009 71 All Rights Reserved, Edward Tsang

## Why Agent Modelling

- ◆ Agent modelling allows
  - Heterogeneity
  - Geographical distribution
  - Micro-behaviour to be modelled
- ◆ Representative models don't allow these
- ◆ Micro-behaviour makes the market

21 February 2009 72 All Rights Reserved, Edward Tsang

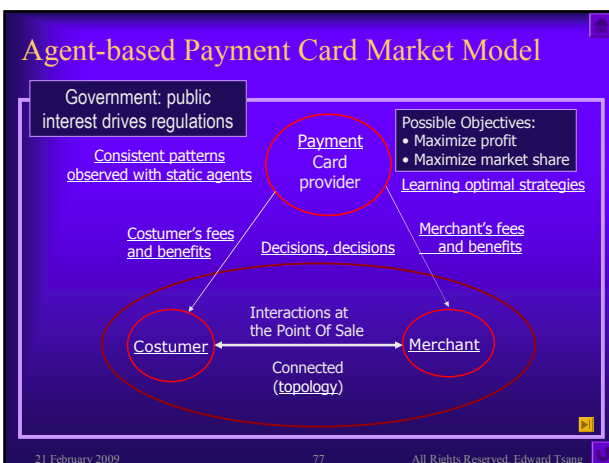

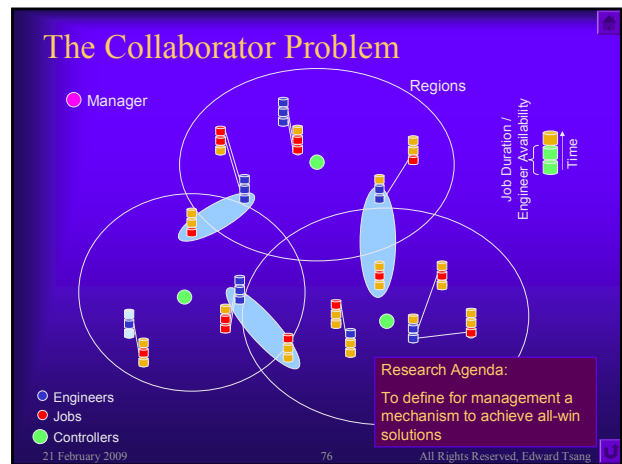

- ### Conclusion, Credit Card Payment Analysis
- ◆ Market behavior is complex and hard to analyze
  - ◆ APCM is useful for studying the card market
    - It is a good model of consumers and merchants behavior
    - Could be used to predict demands
  - ◆ GPBIL could be used for searching strategies under certain requirements
  - ◆ Observation: rich results... e.g.
    - Market info determines outcomes
    - More information → less dominance
- 21 February 2009 74 All Rights Reserved, Edward Tsang

### Market-based Scheduling

Staff Empowerment for BT's workforce scheduling

21 February 2009 75 All Rights Reserved, Edward Tsang

### Research Profile, Edward Tsang

Business Applications of Artificial Intelligence

Application	Technology
Finite Choices Decision Support, e.g. Assignment, Scheduling, Routing	Constraint Satisfaction, Optimisation, Heuristic Search (Guided Local Search)
Financial Forecasting	Genetic Programming
Automated Bargaining	Genetic Programming
Wind Tunnel Testing for designing markets and finding winning strategies	Mathematical Modelling, Machine Learning, Experimental Design
Portfolio Optimisation	Multi-objectives Optimisation

21 February 2009 78 All Rights Reserved, Edward Tsang
